

Monsoon and Globus

Utilizing Globus tools for fast, easy, & powerful data sharing

Presentation media, including this slide-stack: rcdata.nau.edu/hpcpub/globus

Presentation topics

- General introduction to Globus' capabilities and benefits
- Understanding its user-facing architecture
- Applicable use-cases (or alternative approaches)
- Usage walk-throughs (web client and command line)
- Personal end-points for workstations
- Group collaboration with both edu AND unaffiliated users

Globus: multi-use data sharing utility

What: Globus is a great solution for transferring data to/from Monsoon, as well as to the local filesystems of other Universities and research facilities.

Using its simple web interface like a virtual remote control, users may submit instructions for data-transfers, or may schedule data-syncs... and Globus takes it from there! It can even update you via email about status or exceptions. How: Your data is transferred directly between the source and destination systems. Meanwhile, the service tunes performance parameters, maintains security, monitors progress, and validates correctness. You can check the transfer status at any time via a dashboard.

When: If a network/hardware issue is encountered, Globus will automatically resume when all components are ready. Even if an issue requires user intervention, Globus will resume after you've remedied the problem.

How your bytes become a file

- Local

- SOFTWARE 🔁 disk
- disk 🔁 OS 🔁 disk
- disk → SOFTWARE → disk
- Remote
 - remote disk
 - - → network
 - - →local disk

How your bytes become a file (II)

- Local

- WORD PROCESSOR 🔁 disk
- WEB BROWSER 🔁 disk
- *GLOBUS* <u>PERSONAL</u> → disk

- Remote

- remote HPC disk (e.g. @ ASU)
 ⇒ GLOBUS SW (running on cluster)
 ⇒ network
 - →GLOBUS SW (on Monsoon)
 - Iocal HPC disk (e.g. /home, /scratch, /projects, etc)

Architecture of a Globus transfer

Globus transfers

What is a Globus 'collection'?

A collection is a named set of files which are hierarchically organized in folders, and associated with a specific storage gateway.

- Mapped collection: Access requires a user to have a local account. Their Globus identity is mapped to their local account and its local filesystem.
- Guest collection: Access is based on permissions explicitly granted by an authenticated collection owner.

- Collection access is authenticated:
- 1. Users: Globus Auth-issued OAuth2 access tokens, and audit-consents
- 2. Files: with data access policies defined in the collection itself (ACLs)

What is a Globus 'collection'?

Globus 'collections'

A Globus "collection" is simply a pre-defined set of files accessible via Globus' filesharing software.

For example, Monsoon hosts the **NAU HPC Filesystems** collection through Globus' server-software (which runs on the dtn1 login-node).

Individual users may also install/run Globus Connect Personal on their own desktop/laptop to enable transfers between PC \leftrightarrow any other endpoint.

Globus use-cases

Globus is well suited for transferring data sets to and from an HPC resource like Monsoon, without the need for a command line or extensive technical knowledge.

This also comes in especially handy when a user wants to make a quick file transfer, and may not have access to a terminal: only a web browser is needed in most cases.

Globus is a fantastic solution for transferring data between/among different collaborators, *especially* when the size of the data or number of files gets relatively large.

- $\underset{\text{Monsoon}}{\overset{}\leftrightarrow} \text{personal PCs}^*$
- Monsoon ↔ other HPCs/Edus**
- My Monsoon ↔ your Monsoon
- $\underset{A}{\cong} PC_{A} \leftrightarrow PC_{B}^{*}$
- **Remote collaborator**(s) \leftrightarrow Monsoon
 - NAU-affiliated, or not
 - Different slurm or enterprise group
- Time consuming & complex xfers
- 💥 Advanced
 - CLI tools (via conda) and APIs

Globus' capabilities and benefits

- Secure!
 - Highly customizable, granular permissions
 - Share as read-only or full-access
 - Require logins, or allow anonymous access
- Direct transfers between Monsoon ↔ *other institutions*' filesystems
 - Networked-filesystem to networked-filesystem!
 - Simple copies, or (schedulable!) sync tasks
- Also between Monsoon ↔ personal PCs, G-Drive, OneDrive...
- Web-based interface no user-software required
 - CLI tools also available, as alternative to web

Globus 'collections'

- A Globus "collection" is simply a pre-defined set of files accessible via Globus' filesharing software.
- For example, Monsoon hosts the NAU HPC Filesystems collection through Globus' server-software (which runs on the dtn1 login-node).
- Individual users may also install/run Globus Connect Personal on their own desktop/laptop to enable transfers between PC ↔ any other endpoint.

Demo 'A': Quick Globus interface tour

Transfer options (1/2)

sync - only transfer new or changed files

Selecting this option gives the ability to choose how files will be overwritten on the destination file system.

the

where

checksum is different checksum is different file does not exist on destination file size is different modification time is newer

(I)

 delete files on destination that do not exist on source

Files which do not exist on the source endpoint, but do exist on the destination endpoint will be deleted from the destination endpoint.

 preserve source file modification times (i)
 After transfer of a file, the modification time on the destination will reflect the modification time on the source instead of the time the transfer completed. do NOT verify file integrity after transfer

After transfer, verify that the source and destination file checksums match. If they don't, retransfer the entire file and keep trying until it succeeds. If a collection is configured to disable verification of file integrity, this option is ignored.

 (\mathbf{i})

encrypt transfer (j)

Encrypt the data while it is being transferred. If encryption is requested but is not supported by an endpoint, Globus will signal an error. Please visit https://docs.globus.org/faq/security/ for more information on our encryption approach.

□ Skip files on source with errors (i)

Files on source with "file not found" and "permission denied" errors will be skipped rather than cause the transfer to fail.

Transfer options (2/2)

□ Fail on quota errors (j)

If the storage quota is exceeded during the transfer, the transfer will fail rather than retry.

Disable success notification (i)

An email will not be sent when this transfer succeeds.

Disable failure notification (i)

An email will not be sent when this transfer fails.

Disable inactive notification (i)

An email will not be sent when this transfer becomes inactive.

Globus sign-in options

Exercise #1: login & browse your files

1. Visit app.globus.org in a browser

2. Select NAU under Use your existing org login, then Continue
3. Type "nau" in the Collection field to filter for Monsoon-based
4. Click on the NAU HPC Filesystems title *...and explore!*5. Read and authorize all "consents" you are presented with

NOTE: Non-HPC users can

- Browse OneDrive & G-Drive,
- but not NAU HPC Filesystems

Cool stuff:

- You can *manually* change the Path field
- You can "bookmark" a folder within a collection
- What else caught your attention?
