Intro to Monsoon and Slurm

9/7/2022

Slides:

https://rcdata.nau.edu/hpcpub/workshops/odintro.pdf

Supplemental video:

https://rcdata.nau.edu/hpcpub/workshops/odintro.mp4

Get logged in!

- Slides here:
 - https://rcdata.nau.edu/hpcpub/workshops/odintro.pdf
- From a Computer:
 - Log into NAU VPN if off-campus!
 - Instructions here: https://in.nau.edu/its/remote-services/
 - VPN requires Two Factor Authentication
 - https://nau.service-now.com/kb_view.do?sysparm_article=KB0013321
 - Open a web browser
 - May need to search in start menu for it
 - Browse to http://ondemand.hpc.nau.edu
 - Log in with your louie id
 - Click on Clusters tab, and select Monsoon login-node shell

•HIT RECORD! ©

Introductions

- Introduce yourself
 - Name
 - Department / Group
 - What project(s) do you plan to use monsoon for?
 - Linux or Unix experience
 - Previous cluster experience?

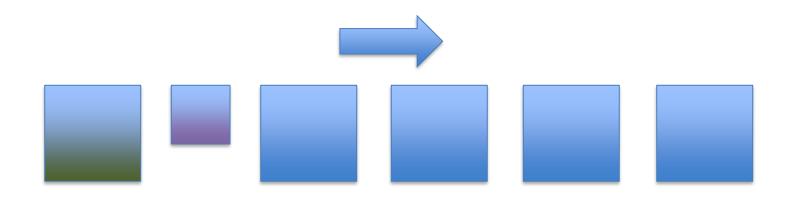

List of Topics

- Cluster education
 - What is a cluster, exactly?
 - Queues, scheduling and resource management
- Cluster Orientation
 - Monsoon cluster specifics
 - How do I use this cluster?
 - Group resource limits
 - Exercises
 - Question and answer

What is a queue?

- Normally thought of as a line, FIFO (Line at Starbucks)
- Queues on a cluster can be as basic as a FIFO, or far more advanced with dynamic priorities taking into consideration many factors

What is scheduling?

- "A plan or procedure with a goal of completing some objective within some time frame"
- Scheduling for a cluster at the basic level is much the same. Assigning work to computers to complete objectives within some time availability
- Not exactly that easy though. Many factors come into play scheduling work on a cluster.

Scheduling

- A scheduler needs to know what resources are available on the cluster in order to make accurate scheduling decisions
- Resource availability changes by the minute
- Assignment of work on a cluster is carried out most efficiently with the scheduler and resource manager working together

Resource Manager

- Monitoring resource availability and health
- Allocation of resources
- Execution of resources
- Accounting of resources

Our Scheduling Goals

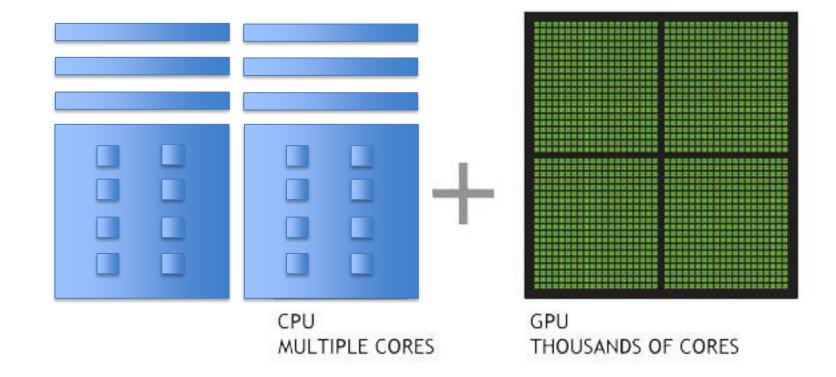

- Optimize quantity of work
- Optimize usage of resources
- Service all users and projects justly
- Make scheduling decisions transparent

Cluster Resources

- Node
- Memory
- CPU's
- GPU's
- Licenses

MEMORY (e.g. DIMMs)

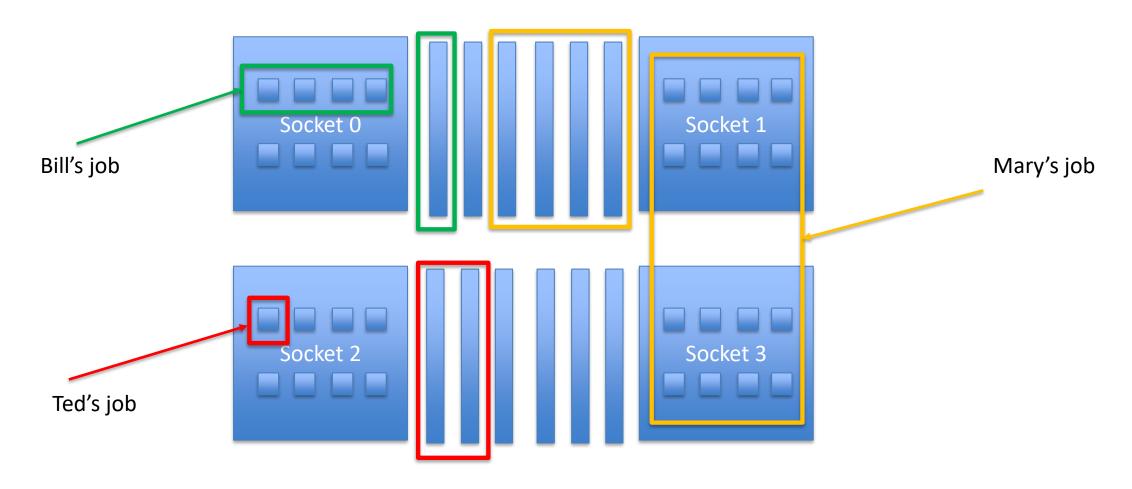

Many scheduling methods

- FIFO
 - Simply first in first out
- Backfill
 - Runs smaller jobs with lower resource requirements while larger jobs wait for higher resource requirements to be available
- Fairshare
 - Prioritizes jobs based on a users recent resource consumption

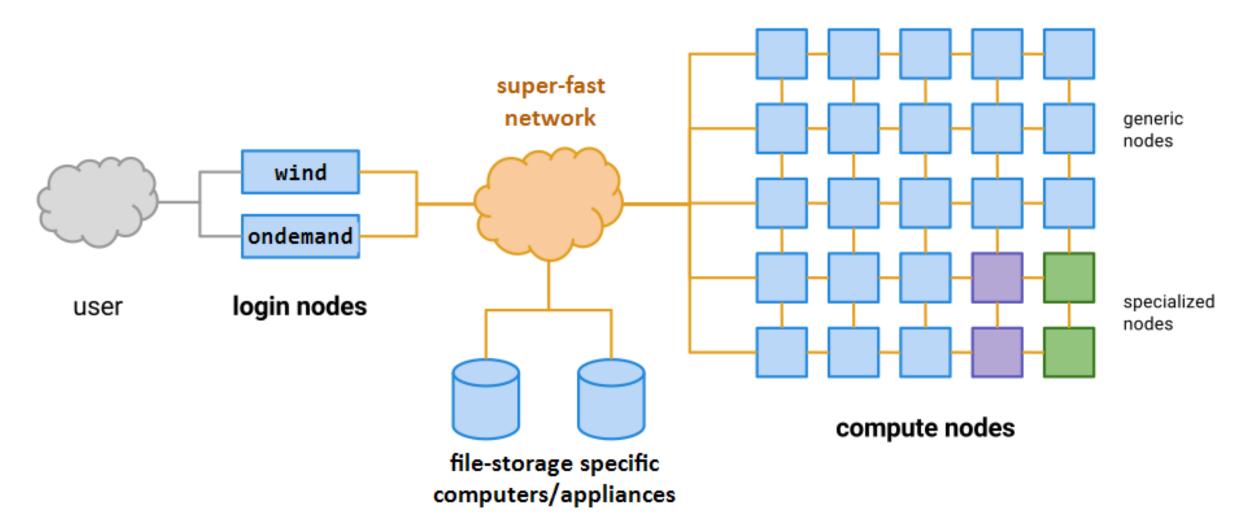

Inside a (single) Node

Cluster = Login-nodes + Compute-nodes + etc

Monsoon Today

- The Monsoon cluster is a resource available to the NAU research enterprise
- 108 systems (nodes) cn[1-108]
- 4076 Intel, and AMD cores
- 27 GPUs, NVIDIA Tesla K80, P100, V100, A100
- Red Hat Enterprise Linux 8.6
- 26TB memory 128GB/node min, 2TB max
- 1PB high-speed scratch storage (Lustre)
- 615TB long-term storage (ZFS)
- High speed interconnect: FDR, and HDR Infiniband

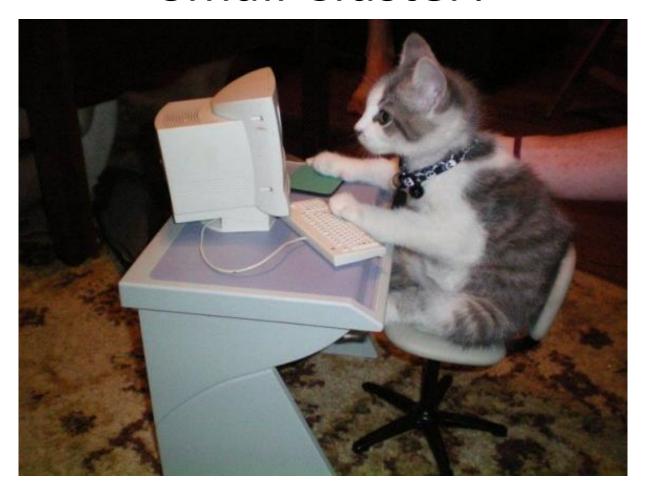

Slurm ... yummm

- Slurm (Simple Linux Utility for Resource Management)
- Excellent resource manager and scheduler
- Precise control over resource requests
- Developed at LLNL, continued by SchedMD
- Used everywhere from small clusters to the largest clusters:

- Frontier (#1), 8.7M cores, 1,102 PF, 21 kW USA
- Fugaku (#2), 7.6M cores, 537 PF, 30 kW Japan

Small Cluster!

Dual core?

Largest Cluster!

8.7M cores

Monsoon scheduling

- Combination of scheduling methods
- Currently configured to utilize backfill along with a multifactor priority system to prioritize jobs

Factors attributing to priority

- Fairshare (predominant factor)
 - Priority points determined on users recent resource usage
 - Decay half life over 12 hours
- QOS (Quality of Service)
 - Some QOS have higher priority than others, for instance: debug
- Age how long has the job sat pending
- Job size the number of nodes/cpus a job is requesting

Storage

- /home 10GB quota
 - Keep your scripts and executables here
 - Snapshotted twice a day: /home/.snapshot
 - Please do not write job output (logs, results) here!!
 - Run the command "quota" now
- /scratch 1PB total space, 30 day retention
 - Very fast storage, capable of 20GB/sec
 - Quota: 15TB, 2M files
 - Checkpoints, logs
 - Keep all temp/intermediate data here
 - Should be your default location to perform input/output

Storage

- /projects 615TB
 - Long-term storage project shares
 - 5TB is assigned to faculty member for group to share
 - \$24/TB/year above 5TB
 - Snapshots available
 - Backups available \$.10/GB/month
- /common
 - Cluster support share
 - Contrib: place to put software/libs/confs/db's for others use

Data Flow

- 1. Keep scripts and executables in /home or in Ondemand
- 2. Write logs/temp/intermediate data to /scratch/<uid>
- 3. Copy data to /projects/<group_project>, for group storage and reference in other projects
- 4. Cleanup /scratch files

** Remember, /scratch is a scratch filesystem, used for highspeed temporary, and intermediate data

Remote storage access

- Via Ondemand
 - Drag and drop files
- scp
 - scp <files> <nauid>@dtn1.hpc.nau.edu:/scratch/<nauid>
 - WinSCP (windows)
 - Fetch (mac)
 - Download from: nau.edu/its/software
- samba / cifs
 - Windows: \\shares.hpc.nau.edu\cirrus
 - Mac: smb://shares.hpc.nau.edu/cirrus
- Globus
 - https://nau.edu/high-performance-computing/globus/

Data transfer node

- We have a dedicated (login-node) system for transferring data
- This host's name is dtn1.hpc.nau.edu
- Use dtn1 for moving large datasets around on monsoon, and to/from the internet

Groups

- NAU has a resource called Enterprise groups. Enterprise Groups are utilized to manage who has access to specific folders and files on the cluster
- They are available to you on the cluster if you'd like to manage access to your data
- https://my-old.nau.edu
 - "Open directory services"
 - "Enterprise groups"
 - Take a look at our FAQ :: https://nau.edu/high-performance-computing/faqs/
 - If they are not working for you, contact ITS Solution Center
- What groups are you in? Run the command "groups", or "id"

Software

- Matlab
- Mathematica
- R
- SAS
- Qiime2
- Anaconda Python
- Lots of bioinformatics programs
- Request additional software to be installed!

Modules

- Software environment management handled by the modules package management system. This is available through the Command Line Interface (cli)
- module avail ...what modules are available
- module list ...modules currently loaded
- module load <module name> ...load a package module
- module display <module name> ...detailed information including environment variables effected

Requesting Software

- You can install quite a bit of R, and python software yourself!
- For R
 - module load R
 - -R
 - install.package(c(package))
- For python
 - module load anaconda3/<ver>
 - conda create -n myenv
 - conda activate myenv
 - conda install package
- You are also welcome to compile your own programs
- If you'd like our help installing a piece of software, please have your research sponsor request it here:
 - https://in.nau.edu/high-performance-computing/request-software/

MPI

- Quick note on MPI
- Message Passing Interface for parallel computing
- Open MPI set as default MPI
- Example MPI job script:
 - /common/contrib/examples/job_scripts/mpijob.sh

Interacting with Slurm

- What resources are needed?
 - 2 cpus, 12GB memory, for 2 hours?
- What steps are required?
 - Run prog1, then prog2 ... etc
 - Are the steps dependent on one another?
- Can your work, or project be broken up into smaller pieces?
 Smaller pieces can make the workload more agile.
- How long should your job run for?
- Is your software multithreaded, uses OpenMP or MPI?

Job Scripts and sbatch

- Except for limited testing and debugging, all jobs on the cluster should be run via a shell script which is typically denoted by the extension .sh on the filename
- sbatch shell scripts are composed of three sections:

- 1. Slurm job parameters (#SBATCH)
- 2. module loading
- 3. srun job steps/statements for the actual work

Example Job script

```
#!/bin/bash
#SBATCH --job-name=test
#SBATCH --output=/scratch/NAUID/output.txt # the stdout from your job goes here
#SBATCH --time=20:00 # shorter time = sooner start
#SBATCH --chdir=/scratch/NAUID # default location slurm searches

# replace this module with software-
# modules required by your jobscript
module load anaconda3/2021.11 # loads a specific anaconda python

# example job commands: each srun command is
```

a job step, so this job will have 2 steps

srun sleep 300

srun python -V

Example Job script (in Ondemand's editor)

```
1 888 1
                                              a ondemand.hpc.nau.edu
     Save
              /home/jtb49/ondemand/data/sys/myjobs/projects/default/15/main_job.sh
  1 #!/bin/bash
     #SBATCH --job-name=exercise1
                                                    # the name of your job
     #SBATCH --output=/scratch/abc123/output1.txt # this is the file your output and errors go to
    #SBATCH --time=20:00
                                                     # 20 min, shorter time, quicker start, max run time
    #SBATCH --chdir=/scratch/abc123
                                                     # your work directory ("pwd")
                                                     \# 2000MB = 2GB of memory
    #SBATCH --mem=2000
  7 #SBATCH --mail-type=FAIL
     # load a module, for example
     module load anaconda3
 11
     # Run your application: precede the application command with 'srun'
     # A couple example applications...
     srun date
     srun python --version
     srun sleep 30
     srun pwd
    srun date
 19
```

Job Parameters

You want	Switches needed
More than one cpu for the job	cpus-per-task=2, or -c 2
To specify an ordering of your jobs	dependency=afterok:job_id, or -d job_id
Split up the output, and errors	output=result.txterror=error.txt
To run your job at a particular time/day	begin=16:00begin=now+1hour begin=2010-01-20T12:34:00
Add MPI tasks/ranks to your job	ntasks=2, or -n 2
To control job failure options	norequeuerequeue
To receive status email	mail-type=ALL

Contraints and Resources

You want	Switches needed
To choose a specific node feature (e.g. avx2)	constraint=avx2
To use a generic resources (e.g. a gpu)	gres=gpu:tesla:1, -G1
To reserve a whole node for yourself	exclusive
To chose a partition	partition

Login node vs Compute node

- When you log into "monsoon" interactively or via Ondemand you are "placed" on a login node.
- The login node is a shared system used solely for:
 - Developing scripts
 - Transferring small data
 - Submitting work to the scheduler
 - Analyzing results
 - Debug work less than 30 minutes in length
- The compute nodes are what make the cluster powerful!

Ondemand

 Open Ondemand (OOD) is an interactive Graphical User Interface (gui) to the Cluster. You access it from your web browser at https://ondemand.hpc.nau.edu

Open OnDemand	Files	Jobs -	Clusters -						⊘ Help) T	♣ Logged in as wew	⊕ Log Out

powered by Den Den	nand											

Ondemand File Explorer

 The file explorer is used to explore, and transfer the files in your home, scratch, or other areas on the cluster.

Ondemand Job Composer

The Job Composer is used to create and run jobs.

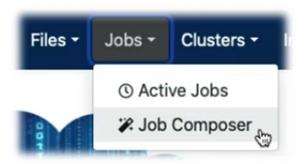

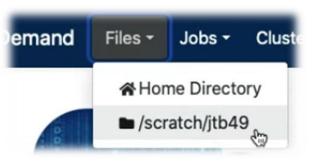

Exercise 1

Create a simple job in the job composer from the template that you will then submit to the scheduler to run on the compute nodes.

- From Ondemand, click the Jobs > Job Composer menu
- Click on New Job and select From Default Template
- Click on Open Editor (bottom of right-column of page)
- Change all "NAUID" to be your nau user-ID, e.g.: abc123!
- Name your job: "exercise1"
- Name & direct your output to /scratch/<NAUID>/exercise1.out
- Load the module named "workshop"
- Run the "date" command
 - i.e.: "srun date"
- Additionally, run the "exercise1" command, as well
- Save (in this tab), and then submit your job via the job composer (previous tab)
- Use the File Explorer to examine your output (Files > /scratch/NAUID)
- Make a note of the secret code in exercise1.out

Exercise 2

- Create a new job using New Job > From Specified Path
- Source path: /common/contrib/examples/job_scripts
- Name: "longjob" (this is your name for your job)
- Script name: "longjob.sh" (this is our existing filename)
- For Cluster and Account: leave empty
- Save, select "longjob" from the Jobs list, and click Open Editor button as before
- Change all "NAUID" to be your nau ID
- Load the module named "workshop"
- Run the "exercise2" command
 - e.g. "srun exercise2"
- Make your job sleep for 5 minutes (sleep 300)
 - Sleep is a command that creates a lazy process that ... sleeps and does nothing
- Save, and then Submit
- Monitor your job by selecting Jobs and Active Jobs from your Dashboard.
- Examine the output in long.txt
- Make a note of the secret code from long.txt

Command-line access

- Once you have the basics down using Ondemand, then the power of the cluster is exposed through the command-line (CLI).
- Access the CLI from the Dashboard, under clusters menu
- Follow along after opening the CLI.
- Feel free to tryout the commands that we will be discussing
- Tip: The Monsoon CLI may also be accessed outside of ondemand via an ssh client such as putty on Windows or Terminal on the Mac.

The Ondemand CLI

You may access the CLI from the dashboard and selecting
 Clusters > Monsoon login node shell

```
Last login: Wed Jan 23 14:50:32 2019 from ondemand.hpc.nau.edu
 Welcome to Monsoon Open Ondemand

    /scratch : files auto DELETED after 30 days

 Issues or questions: hpcsupport@nau.edu
 Upcoming maintenance:
 [wew@ondemand ~ ]$
```

Interactive / Debug Work

- Run your compiles and testing on the cluster nodes by:
 - srun -p all gcc hello.c –o a.out
 - srun --qos=debug -c12 make -j12
 - srun Rscript analysis.r
 - srun python analysis.py
 - Try this now:
 - srun hostname
 - hostname

Long Interactive work

- salloc
 - Obtain a SLURM job allocation that you can work with for an extended amount of time interactively. This is useful for testing/debugging for an extended amount of time.

```
[user1@wind ~ ]$ salloc -c 8 --time=2-00:00:00 salloc: Granted job allocation 33442 [user1@wind ~ ]$ srun python analysis.py [user1@wind ~ ]$ exit salloc: Relinquising job allocation 33442
```

[user1@wind ~]\$ salloc -N 2 salloc: Granted job allocation 33443 [user1@wind ~]\$ srun hostname cn3.nauhpc cn2.nauhpc [user1@wind ~]\$ exit salloc: Relinquising job allocation 33443

Submitting jobs

The sbatch command is used to submit batch jobs to the slurm workload manager. Jobs submitted with sbatch are placed in a queue where they wait for resources to become available.

[user1@wind ~]\$ sbatch jobscript.sh Submitted batch job 85223

 slurm returns a job id for your job that you can use to monitor or modify constraints

Monitoring your job

- squeue
 - view information about jobs located in the SLURM scheduling queue.
- squeue --start
- squeue -u login
- squeue -o "%j %u ... "
- squeue -p partitionname
- squeue -S sortfield
- squeue -t <state> (PD or R)

Cluster info

- sinfo
 - view information about SLURM nodes and partitions.
- sinfo -N -l
- sinfo –R
 - List reasons for downed nodes and partitions

Monitoring your job

- sprio
 - view the factors that comprise a job's scheduling priority
- sprio –l
 - -- list priority of users jobs in pending state
- sprio -o "%j %u ... "
- sprio -w

Monitoring your job

- sstat
 - Display various statistics and information of a running job
- sstat -j jobid
- sstat -o AveCPU, AveRSS

Only works with jobs where analysis is executed with "srun"

Controlling your job

- scancel
 - Used to signal jobs or job steps that are under the control of Slurm.
- scancel -j jobid
- scancel -n jobname
- scancel -u mylogin
- scancel -t pending (only yours)

Controlling your job

- scontrol
 - Used to view and modify Slurm configuration and state.
 - Can change job constraints while it's in pending state, once the job starts, it can no longer be modified
- scontrol show job 85224
- scontrol update jobid=6880341 timelimit=4:00:00

Job Accounting

- sacct
 - displays accounting data for of your jobs and job steps in the SLURM job accounting log or SLURM database
- sacct -j jobid -o jobid, elapsed, maxrss
- sacct -N nodelist
- sacct -u mylogin
- Try our sacct wrapper "jobstats"
 - jobstats -r
 - jobstats -j <jobid>

Job Accounting

- sshare
 - Tool for listing the shares of associations to a cluster.
- sshare -I: view and compare your groups cpu minutes usage
- sshare -a: view all users fairshare
- sshare –A –a <account> : view all members in your account (group)
- group_efficiency <account>

Account hierarchy

- Your user account belongs to a parent faculty account (group)
- Your user account shares resources that are provided for your group
- Example:
 - account1
 - user1
 - user2
- View the account structure you belong to with: "sshare -a -A <account>"
- Example:
 - sshare -a -A account1

Limits on the account (group)

- Limits are in place to prevent intentional or unintentional misuse of resources to ensure quick and fair turn around times on jobs for everyone.
- Groups are limited to a total number of cpu minutes in use at one time: 5M, and gpu minutes: 64K
- This resource limit mechanism is referred to as: "TRESRunMins".
- This limiting mechanism has nothing to do with priority!

Helpful Linux Commands

List Files	Is options -I — to show more information					
Change Directory	<pre>cd <directory path=""> cd by itself will return you to your home directory</directory></pre>					
Show/print current working directory	pwd					
Copy Files	<pre>cp <source/> <destination> use a period for the destination to copy a file to your current directory</destination></pre>					
Move or rename a file	mv <source/> <destination></destination>					
Delete a file	rm <filename></filename>					
Create a directory	mkdir <directory name=""></directory>					
View contents of a file	more <filename> less <filename> cat <filename></filename></filename></filename>					
Edit a file	nano <filename></filename>					
Exit your terminal session (log off)	exit NORTHERN ARIZ UNIVERSITY					

Exercise 3 via CLI

Get to know monsoon and Slurm, on your own. Start by opening a shell to Monsoon.

- 1. How many nodes make up monsoon?
 - Hint: use "sinfo"
 - How many nodes are in the gpu partition?
- 3. How many jobs are currently in the running state?
 - Hint: use "squeue -t R"
- 4. How many jobs are currently in the pending state? Why?
 - Hint: use "squeue -t PD"

Exercise 4 via CLI

- Copy job script and edit:
 - /common/contrib/examples/job_scripts/lazyjob.sh
- Edit the job, change NAUID to be your id
- Save the job
- Submit the job (sbatch lazyjob.sh), it will take 65 sec to complete
- Use sstat and squeue to monitor the job
 - sstat -j <jobid>, and squeue –u <userid>
- Review the resources that the job used
 - jobstats -r
- We are looking for "MaxRSS", MaxRSS is the max amount of memory used
- Edit the job scripts memory request, reduce the memory being requested in MB and resubmit, edit "--mem=", e.g. --mem=600
- Review the resources that the optimized job utilized once again
 - jobstats -r

• Ok, memory looks good, but notice that the usercpu is the same as the elapsed time

Usercpu = num utilized cpus * elapsed time

- This is because the application we were running only used 1
 of the 4 cpus that we requested
- Edit the lazy job script, comment out first srun command, and uncomment the second srun command.
- Resubmit
- Rerun jobstats -r, notice now usercpu is a multiple times the elapsed time, in this case (4). Because we were allocated 4 cpus, and used 4 cpus.
- Now address the egregious time estimate!
- Make a note of the secret code from lazy.txt!

Archived Job scripts

Every job script that is submitted to slurm on monsoon is archived for three reasons:

- Convenience if you forget what script was used for what job, you can find out!
- 2. Support assistance we can find the job script that was used in your job to help troubleshoot with you.
- 3. Security / stability in case of any security or stability issues, we can connect issues and outages to associated jobs

Retrieval of a job script

- Archived job scripts, and their environment are stored here:
 - /common/jobscript_archive/<user>/<year>/<month>
 - <job id>.sh job script
 - <job id>.env job scripts environment
 - Only the individual researcher and our support group can access their job scripts
- Example:
 - User abc123, accessing job id 2600 from March, 2021
 - cat /common/jobscript_archive/abc123/2021/03/2600*.sh
 - cp /common/jobscript_archive/abc123/2021/03/2600*.sh ~/
- Use "showscript" to make it easy!!!!

Showscript Demo

Checking your quotas

 From time to time you may need to examine how much space you are using in the various monsoon storage areas

```
[ricky@wind ~ ]$ getquotas

Filesystem #Bytes Quota % | #Files Quota %

/home 13684M 20000M 68% | - - -
/scratch 67.62G 9.313T 0% | 419K 2M 20%
```

Changing Your Default Account

- All researchers have a default slurm account to track usage
- See it now by: "sacctmgr show user name=<NAUID>"
- Some researchers belong to multiple slurm accounts
- Example to override the default:

#SBATCH --account=prof_lastname

Confirming Your Account

- This is a required step for your account to be fully enabled!
- After completing the exercises: one, two, and four, you will have three, 32 character alpha-numeric codes
- With the codes in hand, confirm your monsoon account with the commands:
 - module load workshop
 - confirm_user
- More information here:
 - https://in.nau.edu/hpc/obtaining-an-account/

Optimizing Your Cluster Use

- To get the most out of the cluster for yourself and your team, it is important to optimize the settings for your jobs.
- Optimization includes memory requested, time for the job to run, number of cpus

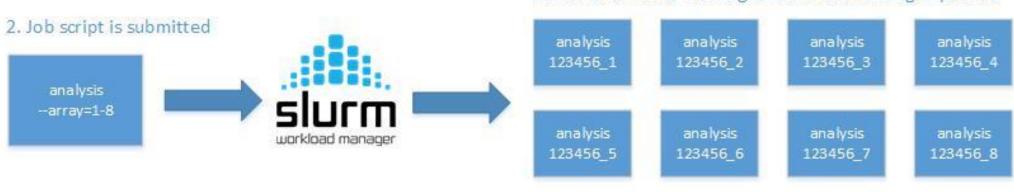

1. Job script is created

Slurm Arrays

analysis --array=1-8

3. Job is launched with eight instances running in parallel

Useful environment variables

SLURM_ARRAY_JOB_ID: the job array's ID (parent)

SLURM_ARRAY_TASK_ID: the id of the job array member n (child)

%A

%a

Slurm Arrays Exercise

- From your scratch directory: "/scratch/nauid"
- tar xvf /common/contrib/examples/bigdata_example.tar
- cd bigdata
- edit the file "job_array.sh" so that it works with your nau id replacing all NAUID with yours
- Submit the script "sbatch job_array.sh"
- Run "squeue", notice there are 5 jobs running, how did that happen!

Keep these tips in mind

- Know the software you are running, is it multi-threaded?
- Request resources accurately
- Supply an accurate time limit for your job
- Don't be lazy, it will effect you and your group negatively

Common Questions

- Should I use OnDemand or the command line?
 - Power users will tend to use command line
 - However, the terminal in ondemand is worth using all the time

Question and Answer
